```
console.clear();

/*

======================================================================

                Operators Interview Questions 🚀

======================================================================

*/

/*

1. What is the difference between == and === in JavaScript?

👉 == checks whether the values of two operands are equal or not. === checks whether the values and data type of two operands are equal or not. For example: 👇

*/

let num1 = 10;

let num2 = "10";

console.log(num1 == num2);

console.log(num1 === num2);

/*

2. Write a program that determines if a person is eligible to drive based on their age being greater than or equal to 18 and having a valid driving license using ternary and logical operators.

👉 If the person is eligible, print "You are eligible to drive". If the person is not eligible, print "You are not eligible to drive". 👇

```

```
*/

let age = 18;

let haveDrivingLicense = true;

// Using Ternary Operator

console.log(age >= 18 && haveDrivingLicense ? "You are eligible to drive." : "You are not eligible to drive.");

/*

3. What is the difference between null, undefined and Not defined in JavaScript?

👉 null is an assigned value representing the intentional absence of any object value.

👉 undefined means a variable has been declared but has not been assigned a value.

👉 Not defined means a variable has not been declared yet but we are trying to access it.

*/

let a;

console.log(a); // undefined

let b = null;

console.log(b); // null

// console.log(c); ReferenceError: c is not defined

/*

4. What is the difference between && and || operators in JavaScript?

👉 && is the logical AND operator. It returns true if both the operands are true.

```

```
👉 || is the logical OR operator. It returns true if at least one of the operands is true.

*/

console.log(true && false); // false

console.log(false || true); // true

console.log(0 || "Hello"); // "Hello"

console.log(5 && 10); // 10

console.log(0 && "Hello"); // 0

/*

5. What is the difference between && and ?? (Nullish Coalescing Operator) in JavaScript?

👉 && is the logical AND operator. It returns true if both the operands are true.

👉 ?? is the nullish coalescing operator. It returns the first non-nullish operand.?? (Nullish Coalescing) only checks for null or undefined and returns the right operand if the left is null or undefined.

*/

console.log(false && "Hello"); // false

console.log(null ?? "Default"); // "Default"

console.log(0 ?? "Fallback"); // 0

console.log("" ?? "Empty"); // ""

/*

13        1101
14        1110
15        1111

*/

// By applying the bitwise operators, we get the following results:

// In this example, the binary representation of 5 is 0101 and 3 is 0011

console.log(5 & 3);

// If the element on both sides is 1, the result will be 1 otherwise 0.

// Result: 0001

console.log(5 | 3);

// If the element on either side is 1, the result will be 1 otherwise 0.

// Result: 0111

console.log(5 ^ 3);

// If the element on both sides is 0, the result will be 0 otherwise 1.

// Result: 0110

```

```
187 console.log(~5);
188
189 // The result will be the one's complement of 5.
190
191 // Result: -6
